Exercise 36 Let D be a right \mathbb{Z} -module and $m \in \mathbb{Z}$. We aim to prove that

$$D \otimes_{\mathbb{Z}} (\mathbb{Z}/m\mathbb{Z}) \cong D/mD$$

where $mD = \{md : d \in D\}$.

1. Define a map $\beta : D \times (\mathbb{Z}/m\mathbb{Z}) \rightarrow D/mD$ by $\beta(d, \bar{a}) = ad + mD$. Prove that β is well-defined and \mathbb{Z} -balanced.
2. By the Universal Property of Tensor Product, we have a group homomorphism $\Phi : D \otimes_{\mathbb{Z}} (\mathbb{Z}/m\mathbb{Z}) \rightarrow D/mD$ such that $\Phi(d \otimes \bar{a}) = ad + mD$. Prove that Φ is an isomorphism.

Proof.

Define $\beta : D \times (\mathbb{Z}/m\mathbb{Z}) \rightarrow D/mD$ by $\beta(d, \bar{a}) = ad + mD$. It is clear that mD is a right \mathbb{Z} -submodule of D . We first show that β is well-defined. Let $a_1, a_2 \in \mathbb{Z}$ such that $\bar{a}_1 = \bar{a}_2$ in $\mathbb{Z}/m\mathbb{Z}$. We claim that $\beta(d, \bar{a}_1) = \beta(d, \bar{a}_2)$. Note

$$\begin{aligned} \bar{a}_1 = \bar{a}_2 &\implies a_1 - a_2 \in m\mathbb{Z} \\ &\implies a_1d - a_2d = (a_1 - a_2)d \in mD \quad \forall d \in D \\ &\implies a_1d + mD = a_2d + mD \\ &\implies \beta(d, \bar{a}_1) = \beta(d, \bar{a}_2) \end{aligned}$$

This shows that β is well-defined.

Next we show that β is \mathbb{Z} -balanced. First, additivity in the first argument:

$$\begin{aligned} \beta(d_1 + d_2, \bar{a}) &= a(d_1 + d_2) + mD = (ad_1 + ad_2) + mD \\ &= (ad_1 + mD) + (ad_2 + mD) \\ &= \beta(d_1, \bar{a}) + \beta(d_2, \bar{a}) \end{aligned}$$

Next, note that $\bar{a}_1 + \bar{a}_2 = \overline{a_1 + a_2}$. We then show additivity in the second argument:

$$\begin{aligned} \beta(d, \bar{a}_1 + \bar{a}_2) &= \beta(d, \overline{a_1 + a_2}) \\ &= (a_1 + a_2)d + mD \\ &= (a_1d + a_2d) + mD \\ &= (ad_1 + mD) + (ad_2 + mD) \\ &= \beta(d_1, \bar{a}) + \beta(d_2, \bar{a}) \end{aligned}$$

Thirdly, to show compatibility with scalar multiplication, by applying additivity in the first and second argument, which we have proved to be true, we see that

$$\begin{aligned} \beta(d \cdot n, \bar{a}) &= \beta(nd, \bar{a}) \\ &= \beta(\underbrace{d + \dots + d}_{n \text{ times}}, \bar{a}) \\ &= \underbrace{\beta(d, \bar{a}) + \dots + \beta(d, \bar{a})}_{n \text{ times}} \\ &= \beta(d, \underbrace{\bar{a}, \dots, \bar{a}}_{n \text{ times}}) \\ &= \beta(d, n\bar{a}) \\ &= \beta(d, n \cdot \bar{a}) \end{aligned}$$

Altogether, this shows that β is \mathbb{Z} -balanced, which proves the first statement.

For the second statement, as mentioned in the statement, by the Universal Property of Tensor Product we have a group homomorphism $\Phi : D \otimes_{\mathbb{Z}} (\mathbb{Z}/m\mathbb{Z}) \rightarrow D/mD$ such that $\Phi(d \otimes \bar{a}) = ad + mD$. We will

show that it is an isomorphism. Firstly, note that Φ is already well-defined by the statement of Universal Property of Tensor Product.

Showing injectivity of Φ is equivalent to showing that it has a trivial kernel, i.e. $\ker \Phi = \{0\}$. First note that since $\otimes_{\mathbb{Z}}$ is \mathbb{Z} -balanced, we have that

$$\sum_i (d_i \otimes \bar{a}_i) = \sum_i (d_i \otimes (a_i \cdot \bar{1})) = \sum_i ((d_i \cdot a_i) \otimes \bar{1}) = \sum_i (a_i d_i \otimes \bar{1}) \quad (1)$$

Suppose $\sum_i (d_i \otimes \bar{a}_i) \in \ker \Phi$ where i is finite, then

$$\Phi \left(\sum_i (d_i \otimes \bar{a}_i) \right) = \Phi \left(\sum_i (a_i d_i \otimes \bar{1}) \right) = \sum_i a_i d_i + mD = 0 + mD$$

This implies that $\sum_i a_i d_i \in mD$, so write $\sum_i a_i d_i = md$ for some $d \in D$. Substituting back to Equation 1, we get that

$$\sum_i (d_i \otimes \bar{a}_i) = \sum_i (a_i d_i \otimes \bar{1}) \stackrel{(*)}{=} \left(\sum_i a_i d_i \right) \otimes \bar{1} = md \otimes \bar{1} = d \otimes \bar{m}$$

where at $(*)$ we apply the additivity in the first argument, one of the property of tensor product being \mathbb{Z} -balanced. Note $\bar{m} = \bar{0}$ in $\mathbb{Z}/m\mathbb{Z}$. To conclude, we have that

$$d \otimes \bar{a} = d \otimes \bar{0} = 0$$

This shows that $\ker \Phi$ is trivial, and thus Φ is injective.

Next, for surjectivity, suppose given $ad + mD \in D/mD$. Then simply consider $d \otimes \bar{a} \in D \otimes_{\mathbb{Z}} (\mathbb{Z}/m\mathbb{Z})$ and see that

$$\Phi(d \otimes \bar{a}) = ad + mD$$

This proves surjectivity of Φ .

Altogether, we have shown that Φ is an isomorphism, and thus

$$D \otimes_{\mathbb{Z}} (\mathbb{Z}/m\mathbb{Z}) \cong D/mD$$

as required. □
